

## A History of the Theory of Elasticity and of the Strength of Materials From Galilei to the Present Time Volume 2, PT. 2

Filesize: 6.91 MB

### ***Reviews***

*This publication is fantastic. It is one of the most amazing publication i have got study. I am just pleased to explain how this is actually the best pdf i have got read through in my individual lifestyle and could be he finest publication for possibly.*

## A HISTORY OF THE THEORY OF ELASTICITY AND OF THE STRENGTH OF MATERIALS FROM GALILEI TO THE PRESENT TIME VOLUME 2, PT. 2

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 198 pages. Dimensions: 9.7in. x 7.4in. x 0.4in. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1893 edition. Excerpt: . . . same title as the latter: see our Arts. 1571-99. (6) Sur les lois de la distribution plane des pressions a linterieur des corps isotropes dans Vital cEquilibre limite. T. Lxxviii. , 757-9 and 786-9. Paris, 1874. In the first part of this paper Boussinesq supposes a conservative system of body-forces applied to a mass under uniplanar strain. The first two body-stress equations then become:  $dxx dxy dj) Q dxy dyy df dx dy dx dx dy dy tf$  being the potential of the body-forces. Hence we find, as in our Arts. 1576-7, for an elastic body:  $dx dy dx dy$  and for a pulverulent or plastic mass:  $(-) (4 (-)-0 ( dx dyjxx yyj dx dy xx yy$  The remainder of the first part of the memoir is devoted to the condition of limiting equilibrium discussed in our Art. 1585. (c) The second part of the memoir is devoted to discussing the integration of equations (i) for the case of limiting equilibrium. Boussinesq, as in our Art. 1568, takes  $T_1$  and  $T_2$  for the principal tractions, and puts  $p = \frac{1}{2}(T_1 + T_2)$ ,  $q = \frac{1}{2}(T_1 - T_2)$ , then for limiting equilibrium  $q$  will be a function of  $p$  and generally a linear one. We have, if  $\alpha$  be the angle the greater traction  $T_1$  makes with the axis of  $x$ :  $xx = p + q \cos 2\alpha$ ,  $xy = -p + q \sin 2\alpha$ ,  $yy = p - q \cos 2\alpha$ . Hence from (i), if  $p = \text{const}$ : Boussinesq remarks that (iv) can be solved when  $1/q$  is a constant, i....
